

BCol1 Function

Description

The BCol1 function is the binary version of Col1(). It will return the numeric value of the character position of the delimiter preceding the extracted data.

Syntax

```
position = BCol1()
```

See also

[Col1](#), [Col2\(\)](#), [BCol2\(\)](#)

Example

```
* Parse a Repository ID
EntID = ANSI_Unicode( "SYSPROG*STPROCEXE**ANSI_UNICODE" )
AppID = EntID [1, "*",1] ; * Will contain "SYSPROG"
precedingPos = BCol1()
```
