

Bit-wise Operators (BitAnd, BitOr, BitXor, BitNot)

Description

Perform bit-wise And, Or, and Xor logical functions on two numbers. BitNot yields the logical Not of a number.

Syntax

BitAnd (expression, expression)
BitOr (expression, expression)
BitXor (expression, expression)
BitNot (expression)

Parameters

The Bit-wise operators have the following parameter.

Parameter	Description
expression	Must yield an integer.

These functions can be used to calculate the binary result from subjecting two integer numbers to And, Or, Xor, and Not evaluation. The result will be an integer. Each number may be up to 32 bits. Hence, $2^{32} - 1$, or 4,294,967,295, is the largest number that can be used by these functions.

Operator	Description
BitAnd	Calculates the bit-wise logical And of two integers.
BitOr	Calculates the bit-wise logical Or of two integers.
BitXor	Calculates the bit-wise logical exclusive Or of two integers.
BitNot	Calculates the bit-wise logical Not of the integer yielded by expression.

Result Tables

Bit in expression 1	Bit in expression 2	BitAnd	BitOr	BitXor
0	0	0	0	0
0	1	0	1	1
1	0	0	1	1
1	1	1	1	0

Bit in expression	BitNot
0	1
1	0

Example

```
subroutine LockColumns(Table, LockCols)
* Table is the fully qualified name of an edit table control
* LockCols is the number of columns in the edit table control that should be horizontally locked
declare function Send_Message
declare subroutine Send_Message
* style bit for the edit table to horizontally lock a column
equ LOCK_STYLE$ to 8192

* get the number of columns in the edit table
ColCount = Get_Property(Table, "LIMIT") <1>
* get the column styles for the edit table
Styles = Send_Message(Table, "COLSTYLE", 0, "")
for i = 1 to ColCount
    if i <= LockCols then
        * turn on the lock style for the column
        Styles<i> = bitor(Styles<i>, LOCK_STYLE$)
    end else
        * turn off the lock style for the column
        Styles<i> = bitand(Styles<i>, bitnot(LOCK_STYLE$))
    end
next i

* set the modified column styles
Send_Message(Table, "COLSTYLE", 0, Styles)
return
```
