CheckLegalUser Function

Description

Checks if the passed user/password combination is legal for the current application and, if so, returns the user level

Syntax

value = **CheckLegalUser** (*User, Password*)

Returns

The following values are returned:

Value	Description
-1	The user/password combination is incorrect
0	The user is a regular user
1	The user is an administrator
2	The user is a system administrator

Example

The following example shows how to evaluate column values by reference to the dictionary column name.

```
/* The following code fragment checks the authorization level of the user "SAM" in the current application */
retval = CheckLegalUser("SAM", "")
```
