

Function Function

Description

Similar to the "call @" syntax for subroutines, the Function syntax allows a function to be called whose name is indeterminate at compile time.

Syntax

RetVal = **Function** (@*Name* (*parameter*, ...))

Parameters

The Function function has the following parameters.

Parameter	Description
<i>name</i>	A variable containing the name of the function to call.
<i>parameter</i>	Any number of parameters can be passed to the function specified by name.
