

# Get\_Status Function

## Description

Returns error status information from a stored procedure. Use after calling any system stored procedure (SSP).

## Syntax

*status* = **Get\_Status** (*status\_code*)

## Parameters

The Get\_Status subroutine has the following parameter.

Parameter	Description
<i>status_code</i>	Returns any error or status codes that have been generated by the previous stored procedure. Multiple codes are @FM-delimited. Optional arguments for each code are values (@VM-delimited) in that field.

## Example

```
Set_Status (0)      ;*make sure status is clear
RList ( "          ", ...)
If Get_Status(status_code) Then
  *RList failed
End
```
