

RTP5 Subroutine (BASIC+ Compiler)

Description

Calls the BASIC+ compiler. You can determine whether a program compiles correctly, and if not, to determine compilation errors.

Use **RTP5** to get more detailed information about the result of a compile than from calling [Recompile_Proc](#) or [Repository\("COMPILE"\)](#).

Syntax

RTP5(tablename, code, parameters, status, type)

Parameters

The RTP5 subroutine has the following parameters.

Parameter	Description																					
tablename	Table containing the row containing the source code to be compiled. Optional.																					
code	A variable containing the code to be compiled. Delimit each line with field marks. <i>Note: If the compilation succeeds, code contains the object code generated by the compiler. If compilation fails, the compilation error messages are returned here, replacing the code. This means that code will never contain the source code after the call to RTP5.</i>																					
parameters	Dynamic array containing two fields: <table border="1"><thead><tr><th>Field No.</th><th>Description</th></tr></thead><tbody><tr><td><1></td><td>Title to display while the compiler is compiling.</td></tr><tr><td><2></td><td>Compiler options (these can be combined): <table border="1"><thead><tr><th>Option</th><th>Description</th></tr></thead><tbody><tr><td>C</td><td>Cut off symbol table</td></tr><tr><td>E</td><td>Return reasons for failure in @FILE.ERROR instead of displaying an error message</td></tr><tr><td>I</td><td>Display \$INSERT message even if S option is set</td></tr><tr><td>N</td><td>Ignore freespace check</td></tr><tr><td>S</td><td>Suppress informational message display</td></tr><tr><td>U</td><td>Do not buffer the compiler</td></tr></tbody></table></td></tr></tbody></table>		Field No.	Description	<1>	Title to display while the compiler is compiling.	<2>	Compiler options (these can be combined): <table border="1"><thead><tr><th>Option</th><th>Description</th></tr></thead><tbody><tr><td>C</td><td>Cut off symbol table</td></tr><tr><td>E</td><td>Return reasons for failure in @FILE.ERROR instead of displaying an error message</td></tr><tr><td>I</td><td>Display \$INSERT message even if S option is set</td></tr><tr><td>N</td><td>Ignore freespace check</td></tr><tr><td>S</td><td>Suppress informational message display</td></tr><tr><td>U</td><td>Do not buffer the compiler</td></tr></tbody></table>	Option	Description	C	Cut off symbol table	E	Return reasons for failure in @FILE.ERROR instead of displaying an error message	I	Display \$INSERT message even if S option is set	N	Ignore freespace check	S	Suppress informational message display	U	Do not buffer the compiler
Field No.	Description																					
<1>	Title to display while the compiler is compiling.																					
<2>	Compiler options (these can be combined): <table border="1"><thead><tr><th>Option</th><th>Description</th></tr></thead><tbody><tr><td>C</td><td>Cut off symbol table</td></tr><tr><td>E</td><td>Return reasons for failure in @FILE.ERROR instead of displaying an error message</td></tr><tr><td>I</td><td>Display \$INSERT message even if S option is set</td></tr><tr><td>N</td><td>Ignore freespace check</td></tr><tr><td>S</td><td>Suppress informational message display</td></tr><tr><td>U</td><td>Do not buffer the compiler</td></tr></tbody></table>	Option	Description	C	Cut off symbol table	E	Return reasons for failure in @FILE.ERROR instead of displaying an error message	I	Display \$INSERT message even if S option is set	N	Ignore freespace check	S	Suppress informational message display	U	Do not buffer the compiler							
Option	Description																					
C	Cut off symbol table																					
E	Return reasons for failure in @FILE.ERROR instead of displaying an error message																					
I	Display \$INSERT message even if S option is set																					
N	Ignore freespace check																					
S	Suppress informational message display																					
U	Do not buffer the compiler																					
status	Boolean result flag (1 = successful compilation; 0 = failed compilation)																					
type	Type of compilation: M = code D = dictionary																					

Note: When RTP5 is called, the compiler attempts to compile the code in code. If compilation fails, the compiler-generated error list is returned here, with the following structure,

<1> = "ERROR.LIST" (a literal)

<2,1> = Line number of error

<2,2> = Error number

<2,3> = Error parameters (as many as necessary)

The error list group in field 2 repeats for all the errors generated by the compilation.

Example

```
/* compile a program that produces the 'Hello world' message */
code = "call msg(@window, 'Hello world')" : @fm: " return 0":@fm:" end"
status = ''
title = 'This is the title to show while compiling.'
type = 'M'
call rtp5('', code,title ,status, type)
```
