

Send_Info Subroutine

Description

The Send_Info subroutine sets the text for the system receiver. If no receiver has been set, the subroutine displays a line of text in the OpenInsight System Monitor.

Syntax

Send_Info (*text*)

Parameters

The Send_Info subroutine has the following parameter:

Parameter	Description
<i>Text</i>	The text to display in the status line or System Monitor.

See also

[STATUSLINE property](#), [SetDebugger\("SPY"\)](#)

Remark

While the system receiver is often whichever control has been set to be the STATUSLINE for a form, it is the system receiver which currently has focus in which the message is displayed. This function is particularly useful for debugging programs; it can be used to display information in the System Monitor without interrupting processing (like the debugger and messages do). In conjunction with [SetDebugger\("SPY"\)](#), you can suppress or display event information on the System Monitor.

Example

```
* example 1: clear status line (if there is a status line)
Send_Info(" ")
* example 2: display a debugging message in the System Monitor
(if there is no status line) */
if assigned(x) then
  Send_Info("Value of x is ": quote(x))
end else
  Send_Info("Value of x is not assigned")
end
```
