

Set_FSError Function

Description

Sets a filing system error to be retrieved by the caller.

Syntax

status = **Set_FSError()**

See also

[Set_Status\(\) function](#) , [RevError.Dat](#), [Get_Status function](#), [FsMsg routine](#)

Remarks

Status will always be 0 (success).

You can use Set_FSError to return filing system errors to the caller. Refer to Set_Status, which incorporates Set_FSError, and provides a more generic error handling method.

Set_FSError transfers the error status of the system variable @FILE_ERROR to the stored procedure status. Any error arguments present at @FILE_ERROR are also returned.

Example

```
*---- @FILE.ERROR field structure ----*  
  
Equate FSCODE$    To 1    ;*error or status code identifier  
Equate FSMSG$     To 2    ;*error message data  
Equate FSDETAIL$  To 3    ;*file system dependent detail data  
  
If @FILE.ERROR<FSCODE$> Then  
    status = Set_FSError()  
    Return  
End
```
