Set_Sort_File Function

Description

This function is used to set the path and file to be used by the sort mechanisms within OpenInsight when write temporary files.

Syntax

filePath = Set_Sort_File(filePath)

Parameters

The function has the following parameters:

Parameter	Description
filePath	A fully named path to which the temporary files should be written. This path must be accessible by the end-user.

Returns

The fully qualified file name of the file used by the sorting mechanisms in OpenInsight. The filename will have a pattern of "R#######.sfx" where # is an integer value.
