

SRP_Regex Match

Determines if the entire string matches the given pattern.

```
IsMatch = SRP_Regex("Match", String, Pattern)
```

Returns

1 if the string matches the given pattern, 0 if not.

Parameters

Parameter	Description
String	The target string to be pattern matched. (REQUIRED)
Pattern	The regex pattern. (REQUIRED)

Remarks

The Match service determines if the given string matches the provided regex pattern. The whole string has to match the pattern to result in a 1. If you're interested in substrings, then you should look into the [Search](#) service.

Examples

```
Pattern = '[Gg]o+gle'
Ans      = SRP_Regex('Match', 'ggle', Pattern)      ; // False
Ans      = SRP_Regex('Match', 'Gogle', Pattern)      ; // True
Ans      = SRP_Regex('Match', 'google', Pattern)     ; // True
Ans      = SRP_Regex('Match', 'Gooooogle', Pattern)  ; // True
Ans      = SRP_Regex('Match', 'goooooooogle', Pattern) ; // True
Ans      = SRP_Regex('Match', 'Google Search', Pattern) ; // False
```
