

3.x - Installing the SRP HTTP Framework

As already documented, The SRP HTTP Framework either ships with the SRP FrameWorks package or it ships separately. When shipped separately it will be delivered as Runtime Deployment (aka RDK) package, usually in .zip format. By default, all entities in the deployment are keyed to the *FRAMEWORKS* application. You may have made special arrangements to re-key the entities to another application.

Installation is as simple as placing the RDK files into an empty folder and running the **RDKInstall** routine to install the entities (e.g., from the System Monitor enter **RUN RDKINSTALL "C:\HTTPFrameworkRDK"**).

Optionally, you can also attach the included sample **CONTACTS** database table which is packaged as a .zip formatted file. Place the linear hash tables in an empty folder and attach them using the Database Manager.

Once this is done, you are ready to move onto the [post-installation configuration of the SRP HTTP Framework](#).
