

Logging_Services

A	
AppendLog	Appends data to the log file associated with the indicated log object handle.
C	
CreateLogFile	Creates (or clears out) a log file associated with the indicated log object handle.
G	
GetColumnDelimiter	Returns the delimiter to use to separate each column in the log.
GetColumnHeaders	Returns the column headers that should be in the log.
GetColumnWidths	Returns the column widths that should be used to truncate or pad each column in the log.
GetLogFileName	Returns the file name for the log file associated with the indicated log object handle. This will not include the path to where the log file is located.
GetLogFullPath	Returns the full path for the log file associated with the indicated log object handle.
GetLogPath	Returns the path for the log file associated with the indicated log object handle. This will not include the name of the log file itself.
GetQuoteValues	Returns the flag to indicate whether column values should be quoted or not.
GetRowDelimiter	Returns the delimiter to use to separate each row in the log.
N	
NewLog	Returns an object handle to a log file.
