CellColors

A cell's color scheme.

Usage

```
Set_Property(OLECtrlEntID, "OLE.CellColors[field; record]", Array)
```

Values

Array has the following structure:

Pos	Name	Type	Description	Default
<1>	Foreground Color	Color	Color of the cell's text	None
<2>	Background Color	Color Fill	Color of the cell's background	None
<3>	Edit Foreground Color	Color	Color of the cell's text while in edit mode	None
<4>	Edit Background Color	Color	Color of the cell's background while in edit mode	None
<5>	Edit Border Color	Color	Color of the cell's border while in edit mode	None

Indices

Index	Description
field	Index to an existing field
record	Index to an existing record

Remarks

The CellColors property allows you to customize the color of individual cells.

The first two fields set the cell's text and background colors. By default, these fields are set to "None", which indicates that the cell's colors should default to those specified by the AutoColors property. Set either of these to "Auto" to use the Windows system color scheme, or set them to any other color value of your choosing.

The other three fields set the cell's colors while it is in edit mode. By default, these fields are set to "None", which indicates that the cell's edit-mode colors should default to those specified by the SelectionStyle property. Set any of these values to "Auto" to use the Windows system color scheme, or set them to any other color value of your choosing.
