

CellComboRowData

A cell's selected combo box row of data.

Usage

```
Array = Get_Property(OLECtrlEntID, "OLE.CellComboRowData[field; record]")
```

Values

Array has the following structure:

Pos	Name	Type	Description
<1>	Data	Text	The data from a column in the selected row of the drop down list

Indices

Index	Description
field	Index to an existing field
record	Index to an existing record

Remarks

The CellComboRowData is a useful property for getting all the data from the currently selected row of a cell's combo box drop down list. Since the cell only contains a single value from the dropdown list's selected row, you can use this property to get the all the other columns in the row as well. The columns are delimited by field marks.

If there is no selection defined for the cell, then this property is blank. If you need data from a non-selected row, read the CellType property for the cell instead.

This property is only valid for cell's whose [CellType](#) property has been set to "Combo."

Example

```
// Get the full row's data from the first cell's combo box selection
RowData = Get_Property(@Window:".OLE_EDITTABLE", "OLE.CellComboRowData[1; 1]")
```
