CellComboSelPos

A cell's combo box selection.

Usage

```
Set_Property(OLECtrlEntID, "OLE.CellComboSelPos[field; record]", Value)
```

Values

Value can be any positive or negative whole number:

Default: 0

Indices

Index	Description
field	Index to an existing field
record	Index to an existing record

Remarks

The CellComboSelPos property provides a way to set or retrieve the currently selected row for a cell's combo box. This is useful in situations where the combo box may have repeating values in the Master Column. A value of zero means there is currently no selection.

This property is only valid for cell's whose [CellType](#) property has been set to "Combo."

By default, whenever a cell is set to be a "Combo" type cell, it's CellComboSelPos value is reset to 0. Therefore, you are responsible for initializing this property for each combo box cell if you so desire.

Example

```
// Get the first cell's combo box sel pos
ComboSelPos = Get_Property(@Window:".OLE_EDITTABLE", "OLE.CellComboSelPos[1; 1]")

// Change the first cell's combo box sel pos programmtically to 2
Set_Property(@Window:".OLE_EDITTABLE", "OLE.CellComboSelPos[1; 1]", 2)
```
