HeaderMultilined

Establishes whether a header cell is single-lined or multi-lined.

Usage

```
Set_Property(OLECtrlEntID, "OLE.HeaderMultilined[col; row]", Boolean)
```

Values

[True | False]

Default: False

Indices

Index	Description
col	Index to an existing header column
row	Index to an existing header row

Remarks

The HeaderMultilined property establishes whether a header cell's text is always one line or can have multiple lines. Single-lined header place all their text in one long line. Multi-lined cells allow line breaks to add more lines of text.

When getting or setting this property, the edit table swaps the currently established multiline delimiter with carriage return-line feeds and vise versa. By default, the multiline delimiter is the text mark (@TM), but you can change this via the MultilineDelim property.
