SRP Splitter Control

The ***SRP Splitter Control*** is an alternative splitter bar to that which comes with OpenInsight. The OpenInsight splitter bar works fine in simple scenarios, but the complex your user interface becomes, the cumbersome it can be to use it.

The SRP Splitter Control puts control into the hands of the developer. Instead of attempted to automatically resize controls in real time, the SRP Splitter Control allows the user to drag and release a ghost bar. After the user releases, an event is sent to OpenInsight allowing you--the developer--to choose exactly how to respond to the bar's new desired location.

With the SRP Splitter Control, you can have embedded splitters that behave nicely with each other and avoid the flicker of seeing dozens of controls attempting to resize in realtime.
