

UpdateCellEdit

Applies changes made in currently editing cell.

Syntax

```
rv = Send_Message(Ctrl, "OLE.UpdateCellEdit")
```

Returns

The selected cell's new contents.

Remarks

Applies any changes made by the user so far in a cell. This function will fire the BeforeUpdate and AfterUpdate events, but they will not be able to be cancelled.

The return value has the following multivalued structure:

| Pos | Name | Type | Description |
|--------|--------|-------------------------|--------------------------------------|
| <1> | Text | Text | The edited cell's new contents |
| <2, 1> | Field | Integer | The field index of the updated cell |
| <2, 2> | Record | Integer | The record index of the updated cell |
