

OnChar

Fired when the user types a character in edit mode.

Parameters

Parameter	Description
Cell	Cell currently being edited
Char	The character entered by the user
Text	The current contents including the new char

Remarks

The OnChar event is fired everytime the user enters a character into a cell in edit mode. Use this event when you need to perform real time update logic, such as enabling and disabling of controls based on the cell's current contents.

This is not a replacement for [BeforeUpdate](#) or [AfterUpdate](#), which fire only if the user commits his/her changes.
