

# OnCheckChanged

Fired when the user changes the state of a cell's check box.

## Parameters

Parameter	Description
Cell	The cell whose check box's state has changed
OldCheckVal	The check box's old state
NewCheckVal	The check box's new state

## Remarks

The OnCheckChanged event is fired when the user clicks the check box in a cell.

The OldCheckVal parameter contains the check box's previous state, which is one of three values: 0 (unchecked), 1 (checked), or 2 (undetermined). Likewise, the NewCheckVal parameter contains the check box's new value.

Use the CellCheck property of the cell if you wish to programmatically change the value of the cell's check box.
