

# Multivalued

Multiple delimited values.

Multivalued properties accept BASIC+ delimited arrays, which can be delimited by field marks, value marks, sub-value marks, etc. When setting a Multivalued property, blank fields will leave the property's current field unchanged. For example, to change only the 3rd field in a 3 field Multivalued property, pass: *@FM:* *@FM:'NewValue'* or *@FM: @FM:'NewValue'*.

The structure of a Multivalued property is property-specific, so refer to each OLE control's reference manual for details.
