

# ItemHyperlink

Determines if an item's text is a hyperlink.

## Usage

```
Set_Property(OLECtrlEntID, "OLE.ItemHyperlink[col; record]", Boolean)
```

## Values

*[True | False]*

**Default:** False

## Indices

Index	Description
col	The index to a column in the report table
record	The index to a record in the report table

## Remarks

The ItemHyperlink property determines whether or not an item's text behaves as a hyperlink. By default, the item is automatically a hyperlink if its column's [ColumnHyperlink](#) property is true. If so, all newly added rows will be hyperlinks in that column. You can then use this property to selectively enable or disable hyperlinks on a per item basis.

When enabled, the [OnItemHyperlink](#) event fires when the user clicks on the item's text.

***Just like the SRP EditTable Control, you must separate the column and record index by a semicolon, not a comma.***

## Example

```
// Disable the hyperlink on row 10
Set_Property(@Window:".OLE_REPORTTABLE", "OLE.ItemHyperlink[2;10]", 0)
```
