

ItemValue

An item's value.

Usage

```
Set_Property(OLECtrlEntID, "OLE.ItemValue[col; record]", Boolean)
```

Values

Text can contain anything.

Default: ""

Indices

Index	Description
col	The index to a column in the report table
record	The index to a record in the report table

Remarks

The ItemValue property returns the item's value, which is determined by the column's [ColumnDataSource](#) setting. If the data source is **Text**, then this property is the same as the [ItemText](#) property. If the data source is **CheckBox**, then this property is the same as the [ItemChecked](#) property. If the data source is **Both**, then this property is the check box value, followed by the text value, @FM delimited.

Just like the SRP EditTable Control, you must separate the column and record index by a semicolon, not a comma.

Example

```
// Get an item's value
Value = Get_Property(@Window:".OLE_REPORTTABLE", "OLE.ItemValue[2;1]")

// Set an item (whose data source is Both) in record 10, column 3
Set_Property(@Window:".OLE_REPORTTABLE", "OLE.ItemValue[3;10]", 1:@FM:"Hello, World.")
```
