

# RecordList

The entire data contents of the table in it's original form, unsorted and not grouped. (ReadOnly)

**Version Introduced:** 3.0.3

## Usage

```
Set_Property(OLECtrlEntID, "OLE.RecordList", Array)
```

## Values

*Array* has the following structure:

Pos	Name	Type	Description	Default
<1>	Row	<a href="#">Text</a>	The contents of an entire row	""
<1, 1>	Column	<a href="#">Text</a>	The contents of a cell in the row	""

## Remarks

The RecordList property is very much like the [List](#) property, with one important difference. The List property provides all the data as it appears to the user, which takes sorting and grouping into account. This property returns the data as it was originally supplied to the control, i.e., unsorted and without group rows.

Note also that this property returns the data in it's raw formatting. If you want the data unsorted, ungrouped, but formatted, use the [RecordListFormatted](#) property.

## Example

```
// Read the table's contents, ungrouped and unsorted
RecordData = Get_Property(@Window:".OLE_RECORDTABLE", "OLE.RecordList")
```
