

RowData

The data for a single row.

Usage

```
Set_Property(OLECtrlEntID, "OLE.RowData[row]", Array)
```

Values

Array has the following structure:

Pos	Name	Type	Description	Default
<1>	Item	Text	An item of data within the row	""

Indices

Index	Description
row	The index to a row in the report table

Remarks

The RowData property provides access on a per-row level to data in the report table. The data is returned in a @FM delimited dynamic array. Each item in the array represents the column data for that row and only that row.

Note that some rows in the Report Table do not contain data because they represent group headers. This property does not respond to indexes pointing to a non-data row. In other words, reading the RowData property for such a row returns "" while setting the property has no effect at all.

To get the entire contents of the table, use the List property.

Example

```
// during a click event, read the row data
Row = Param1
RowData = Get_Property(@Window:".OLE_REPORTTABLE", "OLE.RowData[" :Row: " ] ")
```
