

# SelList

The data from all selected rows.

## Usage

```
Array = Get_Property(OLECtrlEntID, "OLE.SelList")
```

## Values

Array has the following structure:

Pos	Name	Type	Description
<1>	Selected Row Data	Text	Data from a selected row
<1, 1>	Selected Column Data	Text	Data from a cell in the selected row

## Remarks

The SelList property can be useful if you need data from the currently selected rows. Rows are @FM-delimited and columns are @VM-delimited, just like the [List](#) property. However, instead of getting all rows' data you only get the data from the selected rows. If there are no selected rows, then the property returns nothing.

***This property is read only.***

## Example

```
// Get the data from the selected rows
SelList = Get_Property(@Window:".OLE_RECORDTABLE", "OLE.SelList")
```
