# **SelPosOrdered**

The list of indexes of the selected rows in selected order.

## Usage

```
Array = Get_Property(OLECtrlEntID, "OLE.SelPosOrdered")
```

#### Values

Array has the following structure:

Pos	Name	Туре	Description
<1>	Selected Row	Integer	Index to a selected row

## Remarks

The SelPosOrdered property is a special read only property designed to provide the list of selected rows in the order they were selected. This is in contrast to the SelPos property, which always returns the selection in ascending order. As with the SelPos property, the selected rows are @FM delimited.

For this property to be useful, the MultiSelect property must be set to 1 or 2.

# Example

```
// Get the list of selected rows in the order they were selected
SelPos = Get_Property(@Window:".OLE_RECORDTABLE", "OLE.SelPosOrdered")
```
