

OnItemCheck

Fired when the user clicks on an item's check box, changing it's value

Parameters

Parameter	Description
Row	Index to the item's row
Column	Index to the item's column
NewValue	The check boxes new value

Remarks

The OnItemCheck event is fired when the user changes an item's check box value:

Row

The Row parameter contains the index to the items' row.

Column

The Column parameter contains the index to the item's column.

NewValue

The NewValue parameter conveniently provides the check box's new value after the user clicked it. It will be 1 if it is now checked, or 0 if it is now unchecked.

When the OnItemCheck fires, the [OnItemClick](#) event still fires thereafter. Take this into account when handling both events.

Example

```
Point Param1 to Row
Point Param2 to Column
Point Param3 to NewValue

If NewValue EQ 1 then
  // Do something when checked
end else
  // Do something when unchecked
end
```
