

OnItemHyperlink

Fired when the user clicks on a hyperlink

Parameters

Parameter	Description
Row	Index to the row that was clicked
Column	Index to the column that was clicked
Text	The item's text

Remarks

The OnItemHyperlink event is fired when the user clicks on a hyperlink. The event provides two parameters: row and column. These two parameters identify the item whose hyperlink was clicked. The Text parameter is provided for convenience. It contains the item's current text.

You can use the [RowToRecord](#) method to convert the row index into a record index.

Example

```
Transfer Param1 to Row
Transfer Param2 to Column
Transfer Param3 to Text

// get the clicked item's value
Record = Send_Message(@Window:".OLE_REPORTTABLE", "OLE.RowToRecord", Row)
ItemValue = Get_Property(@Window:".OLE_REPORTTABLE", "OLE.ItemValue[":Column:":"Record:]")
```
