

OnSelChange

Fired when the user changes the selection

Remarks

The OnSelChange event is fired when the user changes the selection by clicking on a row or by using the arrow keys. To get the new selection, simply read the [SelPos](#) property.

This event does not fire when setting the SelPos property programmatically. Instead, you must programmatically fire the event using Send_Event.

Example

```
// Get the selpos  
SelPos = Get_Property(@Window:".OLE_REPORTTABLE", "OLE.SelPos")
```
