

ServerValid

Determines if the server connection is valid.

Usage

```
Boolean = Get_Property(OLECtrlEntID, "OLE.ServerValid")
```

Values

[True | False]

Remarks

The ServerValid property is a read only property that can be used to determine if the SRP Schedule Control still has a valid connection to the SRP Schedule Server. If it does, this property will return 1. If not, it will return 0.

If the SRP Schedule Server was started after the [Server](#) property was set, then this will still return 0 since there was never a connection made.

Example

```
// See if we lost the connection
If Get_Property(@Window:".OLE_SCHEDULE", "OLE.ServerValid") then
    Msg(@Window, "Connection to the server was lost.")
end
```
