

Animation

Indicates whether or not groups animate when the user selects between them.

Usage

```
Set_Property(OLECtrlEntID, "OLE.Animation", OptionValue)
```

Values

OptionValue can be set to one of the following valid options:

Value	Abbr.	Description
Always	A	Groups animate when resizing
Never	N	Groups never resize instantly
System	S	Groups only animate if the user's system settings allow it

Default: Always

Remarks

The Animation property can be used to enable or disable animation. By default this property is set to "Always". If you dislike the animation or want the control to respond more quickly, then set this property to "Never". A final option is to use "System" which will cause the control to only animate its groups so long as the user's system settings allow it to do so.

Here's a visual difference between animated shortcut bars and inanimated shortcut bars:

Example

```
// Turn off animation
Set_Property(@Window:".OLE_SHORTCUT", "OLE.Animation", "Never")

// Only animate if user system setting allow for it
Set_Property(@Window:".OLE_SHORTCUT", "OLE.Animation", "System")
```
