

# Behavior

The group presentation behavior.

## Usage

```
Set_Property(OLECtrlEntID, "OLE.Behavior", OptionValue)
```

## Values

*OptionValue* can be set to one of the following valid options:

Value	Abbr.	Description
Explorer	E	Allows user to expand and contract multiple groups
List	L	User expands one group at a time
Toolbox	T	User expands one group at a time

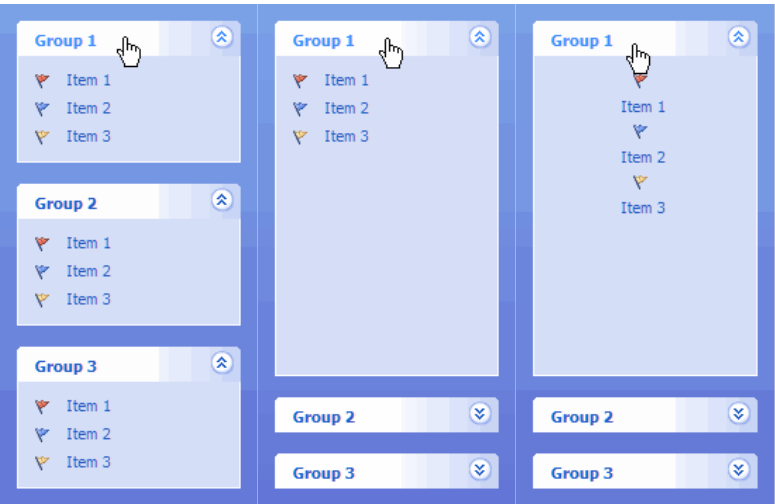

**Default:** Explorer

## Remarks

The Behavior property lets you select between three styles of group presentation.

The "Explorer" behavior allows the user to expand and contract any number of groups, thus emulating the behavior of the task bar in Windows Explorer. This is the default setting.

The "List" and "Toolbox" behaviors are nearly the same in that they both allow the user to view only one group at a time. The difference between them is that the default layout of "List" is images with text below while the default layout for "Toolbox" is image with text on the right. However, you can change the layout of either behavior via the [Layout](#) property.

## Example

```
// Set the behavior to "List", which is similar to the Outlook bar
Set_Property(@Window:".OLE_SHORTCUT", "OLE.Behavior", "List")

// Set the behavior to "Toolbox", which is similar to the Outlook bar with small icons
Set_Property(@Window:".OLE_SHORTCUT", "OLE.Behavior", "Toolbox")
```
