

GroupSelection

A group's selected items.

Usage

```
Set_Property(OLECtrlEntID, "OLE.GroupSelection[group]", Array)
```

Values

Array has the following structure:

Pos	Name	Type	Description	Default
<1>	Selected Item	Integer	Index to a selected item within the group	""

Indices

Index	Description
group	Index to an existing group

Remarks

The GroupSelection property is the list of a group's selected items. This property is an alternative to the [Selection](#) property and is useful when you only need the selection states of a particular group's items.

The property is an @FM delimited array of item indexes. If there are no selected items, then the property will be empty. You may use this property to set the selected items for a group.

Selection will return nothing if either field of the [SelectBehavior](#) property is set to "None". Nor can items be programmatically selected in this case.

Example

```
// Get the selected items for a single group and determine how many there are
GroupSelItems = Get_Property(@Window:".OLE_SHORTCUT", "OLE.GroupSelection[1]")
NumGroupSelItems = Count(GroupSelItems, @FM) + (GroupSelItems NE "")

// Set selected items for a group
GroupSelItems = "1":@FM:"2":@FM:"3"
Set_Property(@Window:".OLE_SHORTCUT", "OLE.GroupSelection[2]", GroupSelItems)

// Remove a group's selection
Set_Property(@Window:".OLE_SHORTCUT", "OLE.GroupSelection[3]", "")

// Remove all groups' selections
Set_Property(@Window:".OLE_SHORTCUT", "OLE.GroupSelection[All]", "")
```
