

# OnSplitterMove

Fired when the user drags and releases the splitter.

## Parameters

Parameter	Description
X	The splitter's new desired X position
Y	The splitter's new desired Y position
Width	The splitter's new desired width
Height	The splitter's new desired height

## Remarks

The OnSplitterMove event is fired when the user moves the splitter to a new location. It's important to note that the splitter does not actually move. Instead, you are notified of the coordinates to which the user dragged and released. It is still up to you, the developer, to move the splitter to that location and, of course, to resize all the other relevant controls.

The X and Y parameter are relative to the top left corner of the form's client area, so you can use them as is to reposition controls.

## Example

```
Transfer Param1 to X
Transfer Param2 to Y
Transfer Param3 to Width
Transfer Param4 to Height

// move the splitter
Set_Property(CtrlEntId, "SIZE", X:@FM:Y:@FM:Width:@FM:Height)
```
