ComboSelPos

A control's combo box drop down selection.

Usage

```
Set_Property(OLECtrlEntID, "OLE.ComboSelPos[CtrlId]", Value)
```

Values

Value can be any positive or negative whole number:

Default: 0

Indices

Index	Description
CtrlId	Identifies a subclassed control

Remarks

Applies To: EDITLINE, EDITBOX

The ComboSelPos property provides a way to set or retrieve the currently selected row for a control's combo box drop down. This is useful in situations where the combo box may have repeating values in the Master Column. A value of zero means there is currently no selection.

By default, whenever a combo box drop down is first added to a control, it's ComboSelPos value is reset to 0. Therefore, you are responsible for initializing this property should you need to do so.

Example

```
// NOTE: using ; and not .
CtrlId = @Window:";EDITLINE"

// Get the combo box sel pos
ComboSelPos = Get_Property(@Window:".OLE_SUBCLASS", "OLE.ComboSelPos[":CtrlId:"]")

// Change the combo box sel pos programmtically to 2
Set_Property(@Window:".OLE_SUBCLASS", "OLE.ComboSelPos[":CtrlId:"]", 2)
```
