

IndexToHandle

Maps a tab index to its corresponding handle.

Syntax

```
Handle = Send_Message(Ctrl, "OLE.IndexToHandle", Index)
```

Parameters

Parameter	Description
Index	Index to an exiting tab

Returns

Handle to the tab

Remarks

The IndexToHandle method maps the index of a given tab to its corresponding handle. Most properties use indexes, but the [AddTab](#) and [RemoveTab](#) methods work with handles. The reverse method, [HandleToIndex](#), can be used to get back a tab's index.

Example

```
// Get the handle to the second tab so we can remove it
TabHandle = Send_Message(@Window:".OLE_TAB", "OLE.IndexToHandle", 2)
Send_Message(@Window:".OLE_TAB", "OLE.RemoveTab", TabHandle)
```
