

RemoveTab

Removes a tab from the control.

Syntax

```
Result = Send_Message(Ctrl, "OLE.RemoveTab", Handle)
```

Parameters

Parameter	Description
Handle	Handle to an exiting tab

Returns

'1' if the tab was found and removed, '0' otherwise.

Remarks

The RemoveTab method removes a given tab from the control. This method does not accept a tag index. You must pass a tab handle instead. If you know only the index of the tab, you can call [IndexToHandle](#) first. If the tab was found and removed, then this method returns '1'.

Example

```
// Get the handle to the second tab so we can remove it
TabHandle = Send_Message(@Window:".OLE_TAB", "OLE.IndexToHandle", 2)
Send_Message(@Window:".OLE_TAB", "OLE.RemoveTab", TabHandle)
```
