

# SRP\_Date MonthNames

All the month names in a given locale.

```
Name = SRP_Date("MonthNames", NameLength = "Full", Locale = "")
```

## Returns

The human readable names for the given month.

## Parameters

Parameter	Description
NameLength	How the names are to be returned: options are "Full" or "Abbreviated". (OPTIONAL)
Locale	A locale for culture specific names. (OPTIONAL)

## Remarks

The "MonthNames" service retrieves the cultural specific names for all the months in an @FM delimited array. The array will contain 12 month names in the order they appear on the Gregorian calendar. The values returned depend on two factors: *NameLength* and *Locale*. *NameLength* can be on of two options: "Full" returns the full names and "Abbreviated" returns the commonly used abbreviations. *Locale* is the [locale name](#) used to target a specific language.

## Examples

```
// Get the full month names in the local culture
Names = SRP_Date("MonthNames")

// Get the abbreviated month names in the local culture
Names = SRP_Date("MonthNames", "Abbreviated")

// Get the abbreviated month names in Spain
Names = SRP_Date("MonthNames", "Abbreviated", "es-ES")
```
