3.x - GetSelfURL

Returns the self URL for the current service.

Syntax

```
Response = HTTP_Services('GetSelfURL')
```

Returns

The URL representing the current web service.

Parameters

N/A

Remarks

This is not the same as the *3.x - GetFullEndPointURL* service, which returns the entire URL submitted by the client. The Self URL is that part of the Full End Point URL that represents the current segment currently being processed by a web service.
