3.x - SetQueryField

Sets the indicated Query field with the indicated value.

Syntax

```
Response = HTTP_Services('SetQueryField', Field, Value)
```

Returns

N/A

Parameters

Parameter	Description
Field	Query field to set. **Required.**
Value	Value for the Query field. This will be Trimmed to enforce proper formatting. **Required.**

Remarks

Query Fields are what appears at the end of a URL which are in this format:

?<field1>=<value1>[&<field2>=<value2>]

Hence, an example of a full URL with a Query Field would look like this:

https://www.mysite.com/api/contacts?name=smith

Query Fields are often used by an API to filter content. The *SetQueryField* service provides a similar functionality as the Inet_QueryParam function, although the latter is only useful with the RUN_OECGI_REQUEST dispatch routine.
