

SRP_HTTP_FRAMEWORK_SERVER_ENABLED

Stores a boolean flag that represents the enabled status of the API server. The [GetServerEnabled](#) service (a member of the [HTTP_Services](#) module) retrieves this flag. The [SetServerEnabled](#) service will update this flag. Note: [SRP_HTTP_FRAMEWORK_SERVER_ENABLED](#) is the default configuration row for all applications. Each local application will copy this and maintain a local version using the format [SRP_HTTP_FRAMEWORK_SERVER_ENABLED*<AppID>](#).
