

# SRP\_Time Span

The number of seconds between times.

```
Seconds = SRP_Time("Span", FromTime, ToTime)
```

## Returns

The number of seconds between two times

## Parameters

Parameter	Description
FromTime	A starting time in OI internal format. <b>(REQUIRED)</b>
ToTime	An ending time in OI internal format. <b>(REQUIRED)</b>

## Remarks

The "Span" service calculates the number of seconds between two times. The result will be positive if the starting time comes before the ending time and negative if the ending time comes first. This is the same as the ["SecondSpan"](#) service.

## Examples

```
// Get the number of seconds between two times
From = SRP_Time("Parse", "7:51:43am", "h:mm:ss tt")
To = SRP_Time("Parse", "12:41:08pm", "h:mm:ss tt")
Seconds = SRP_Time("Span", From, To)
```
