

SRP_DateTime Split

Splits a datetime into a date and time.

```
Info = SRP_DateTime("Split", Datetime)
```

Returns

An @FM delimited array containing the date followed by the time.

Parameters

Parameter	Description
Datetime	A datetime in OI's internal format. (REQUIRED)

Remarks

The "Split" service separates the datetime into date and times, both of which are in their respective internal OI formats. The structure of the return value is as follows:

Field	Description
<1>	The datetime's date in OI's internal date format.
<2>	The datetime's time in OI's internal time format.

This is more convenient than calling the "Date" and "Time" services separately, especially if you use our [unpacking syntax](#). If *Datetime* is not valid, "" is returned.

Examples

```
// Split the current datetime into a date and time the old-fashioned way
Info = SRP_DateTime("Split", DateTime())
Date = Info<1>
Time = Info<2>

// Split the current datetime using unpacking
(Date, Time) = SRP_DateTime("Split", DateTime())
```
