

ControlVisible

Determines if a given control is visible.

Usage

```
Set_Property(OLECtrlEntID, "OLE.ControlVisible[key]", Boolean)
```

Values

Boolean can be True or False.

Default: True

Indices

Index	Description
key	The target control's unique key

Remarks

The ControlVisible property gets or sets the current visibility state of a given control. When you defined the control during the [Init](#) method, you gave it a unique key. You must pass that key in order to show or hide it. When this property is set to false, the control is visibly removed from its group, though it still exists and can be manipulated programmatically.

Example

```
// Hide the copy control
Set_Property(@Window:".OLE_RIBBON", "OLE.ControlVisible[BTN_COPY]", 0)
```
