

TabVisible

Determines if a given tab is visible.

Usage

```
Set_Property(OLECtrlEntID, "OLE.TabVisible[key]", Boolean)
```

Values

Boolean can be True or False.

Default: True

Indices

Index	Description
key	The target tab's unique key

Remarks

The TabVisible property gets or sets the current visibility state of a given tab. When you defined the tab during the [Init](#) method, you gave it a unique key. You must pass that key in order to show or hide it. When this property is set to false, the tab is visibly removed from the ribbon, though it still exists and can be manipulated programmatically.

Example

```
// Hide the Home tab  
Set_Property(@Window:".OLE_RIBBON", "OLE.TabVisible[HOME]", 0)
```
