DRAGEND

Description

This event is fired at a drag source control in response to data being dragged from it.

Syntax

bforward = **DRAGSTART** *(ctrlentID, ctrlclassID, DragResult)*

Parameters

DBLCLK accepts arguments for the following parameters.

Parameter	Description
ctrlentID	Has the format WindowName.ControlName, where WindowName is the identifier of the window that contains the affected control, and ControlName is the identifier of the control. Notice that a period separates the two values.
ctrlclassID	The type of control that recognizes the event.
DragResult	Result of the DragDrop operation. Can be one of the following: CANCEL, COPY or MOVE.

Returns

True or false. If false, the program execution returns to the calling procedure. If true, the event processing goes to the next level.

Remarks

Normal DragDrop operations from one control to another result in the target control copying and rendering the dropped data in it's DRAGDROP event, and the source control deleting it during the DRAGEND event. However, in the case of a MOVE operation within the same control the normal convention is to handle all data movements within the source control DRAGEND event.

This event is fired asynchronously.
