Compute_Dict Function

Description

Returns the result of a dictionary calculation. This is a shell around the Calculate() function. It opens a dictionary to @DICT, sets @ID, reads @RECORD, and calls Calculate.

Syntax

calcresult = **Compute_Dict** *(dictname, row)*

Parameters

The Compute_Dict function has the following parameters.

Parameter	Description
dictname	Specifies the name of the dictionary column to calculate. For dictname, use the format: tablename*columnname.
row	The row to perform the calculate against.

To determine which columns a dictionary item needs to perform a calculation, use the stored procedure Dict_Depend.
