Get_App_Info Function

Description

Retrieves information about the application parameter passed to the function. The information is stored in the SYSAPPS table.

Syntax

result = **Get_App_Info** *(application_name)*

Parameters

The Get_App_Info function has the following parameter.

Parameter	Description
application_name	The name of the application for which the information is to be retrieved.

Returns

result - a field mark delimited variable containing the following information stored in **SYSAPPS**.

Field Number	Description
1	Application name
2	Database ID
3	Template Application Name
4	Creation date and time
5	Company name
6	Author
7	Create permissions
8	Abstract
9	Document reference
10	Document tool
11	Type ID
12	Class ID
13	Entity ID
14	Database Column Support (null = False, 1 = True)
15	Logon Banner Name
16	UTF Enabled (null = False, 1 = True)

Example

After the function is called, the variable application_information will contain the application related information described above.

```
declare function get_app_info
application_information = Get_App_Info('EXAMPLES')
```
