

SRP_Get_Printers

Gets the printers available to the machine.

Syntax

```
Result = SRP_Get_Printers(Option)
```

Returns

An @FM delimited list of printer names.

Parameters

Parameter	Description
Option	Determines which printers are to be returned.

Remarks

The SRP_Get_Printers method is an OIPI-free way to get the list of printers. The option parameter accepts the following values: "DEFAULT", "LOCAL", "SHARE", "CONNECTIONS", "NETWORK", and "REMOTE". Here are the effects of each option:

Parameter	Description
"DEFAULT"	Returns the default printer.
"LOCAL"	Returns the list of printers currently added to the computer.
"SHARE"	Returns the list of printers with the shared attribute set.
"CONNECTIONS"	Returns the list of printers to which the user has made previous connections.
"NETWORK"	Returns the list of network printers on the computer's domain.
"REMOTE"	Returns the list of network printers and print servers in the computer's domain.

If you omit the Option parameter, then "LOCAL" is assumed. Once you have your list of printers, you can optionally pass any one of the printer names to the [SRP_Get_PrinterInfo](#) to get more information about the printer's capabilities.

Example

```
// Get the printers added to the machine
LocalPrinters = SRP_Get_Printers("Local")

// Get the printers available on the network
NetworkPrinters = SRP_Get_Printers("Network")
```
